

IonBreton, combining technology and industry expertise for highly competitive solutions

Breton enters partnership with Ion Machines, an established Turkish company in the construction of resin plants for natural stone materials.

A deep knowledge of natural stone and the needs for the professionals who work with it: this is the fundamental aspect that unites Ion Machines and Breton.

Two important companies have decided to combine their respective technical expertise in resin lines and reinforcement systems for marble and granite slabs and tiles, establishing an ambitious partnership.

Thus, IonBreton is born.

Breton entered into a partnership with the Turkish company Ion Machines and started the production of resin systems for marble and granite slabs and tiles in Turkey.

The company's operational headquarters is in Denizli (TR), in a well-equipped and already operating industrial plant of 4,000 square meters, 2,500 of which are covered.

IonBreton's goal is mainly one: to manufacture **technologically advanced plants that guarantee the best return on investment at customer-friendly prices.**

The decision to manufacture in Turkey, which was made possible first of all by the collaboration with Eng. Kilinc, the CEO of Ion Machines, was determined by the favourable cost conditions, the professionalism of the staff with an established culture in stone processing, and the strategic geographic location to serve various European and Asian markets.

With this action, Breton intends to consolidate its international leadership in marble and granite processing equipment.

The synergy between the technological and construction know-how of Breton and that of Ion Machines ensures a state-of-the-art product, both for "entry level" solutions and for highly automated, high-productivity plants.

The Breton Group

Breton - a pioneer in the development of advanced technologies and materials - has been an international leader since 1963 in the design and production of state-of-the-art machines and industrial plants for processing natural stone, ceramics and metals, and in the development of plants for engineered stone and additive printing.

Founded in 1963 by Cav. Marcello Toncelli, Breton S.p.A. is headquartered in Treviso, Italy (Castello di Godego) and has two other production sites (in Campiglia dei Berici and Vedelago), seven foreign branches, almost a thousand employees, and has established itself on the global market thanks to its philosophy always focused on research and innovation.

Throughout its history, Breton has more than 417 patented inventions, with a total of more than 1700 patents filed worldwide. The company devotes more than 5% of its turnover each year to research and development.
